Abstract

The purpose of this document is to provide detailed information about the estimation of PM_{2.5} (total and attributed to prescribed fires and wildfires) that our work could be reproduced. Figure 1 shows the study area of interest.

Contents

1	Phase 1: Data Sources and Points of Interest for Machine Learning	3
1.1	PM _{2.5} data	4

1 Phase 1: Data Sources and Points of Interest for Machine Learning

For the creation of the spatiotemporal daily exposure surface via machine learning, a large number of data sets will be collected as discussed below. The dependent variable will be daily 24-hour $PM_{2.5}$ from monitoring data.

Figure 1: Map of 11-state study area.

1.1 PM_{2.5} data

1.1.1 Processing PM_{2.5} data

These are the scripts that process and compile the PM_{2.5} data:

1. Script1_Install_Pkgs.R » install packages
 2. Process_PM25_data_step1.R » compiles the various PM_{2.5} data sources into a single data frame. The only eliminations of data are geographic, to remove states that are not in our study area. Update time frame of study if necessary. The output from this script is a csv file and sink .txt for each PM_{2.5} data source as well as a file with all of the PM_{2.5} data sources merged together (“PM25_Step1_part_*.csv”). This script takes about 6 minutes to run on laptop.
 - (a) For DRI data, put in flags for voltage data outside the range 11-17 V. (These thresholds are somewhat arbitrary, but it was noticed that when the voltage was outside this range, the PM_{2.5} concentrations were often absurdly high, e.g., greater than 24,000 ug/m³.)
 3. Process_PM25_data_step2.R » cleans the data. This script takes about 5 minutes on a laptop. The following is a list of the quality cuts and changes made to the data:
 - (a) Replace “UNKNOWN” datum in EPA data with “NAD27” per Colleen’s advice.
 - (b) Remove negative and NA PM_{2.5} concentrations. This includes removing all data for a monitor on a given day if any of the hourly observations were negative.
 - (c) For the hourly data, remove monitor-days that do not have at least 18/24 observations.
 - (d) For DRI data, remove data with voltage flags (which includes flags that came with the data and flags that were put in because the battery voltage was outside the range 11-17 V.
 - (e) For DRI data, remove data at or below 0 L/min for flow. Think about whether a minimum value of flow should be set (higher than zero).
 - (f) June 6, 2014 24-hr average PM_{2.5} concentration from monitor “Smoke NCFS E-BAM #1” (Fire_Cache_Smoke_DRI_Smoke_NCFS_E_BAM_N1.csv) is 24,203 ug/m³. There’s nothing apparent wrong with the hourly data, however, this is the only day of data that made it through the other quality checks from this data file. This suggests that this monitor is suspect, and will be removed.
 - (g) Remove data points with lat/lon outside this box: (50,-126) to (25,-101). These values are defined in general_project_functions.R.
- Process_PM25_data_step3.R » convert all PM_{2.5} data to the same datum (NAD83) and project coordinates. Take the reprojected location info and put it into the data frame with the daily PM_{2.5} data. This script takes about 3 minutes on a laptop.
- Process_PM25_data_step4.R » Take difference between parts d and b to find what locations/dates are only in part d. This script takes about 15 seconds on a laptop.
- (a) part a: early version created while writing code. Disregard.
 - (b) part b: first batch of PM_{2.5} data that was used to extract predictor data, years 2008-2014
 - (c) part c: county centroids, 2008-2014. This work flow has now been moved to the “Locations_of_interest”.
 - (d) part d: second batch of PM_{2.5} data, adds AQS data for 2015-2018.

4. Process_PM25_data_step5.R » composite replicate data - in process. **To Do** finish colocated version of code to go with aves version of code. Calls these functions:
 - (a) Combine_true_replicates_R_function.R
 - (b) fill_in_aves_coloc_unique_PC_POC_MN_function.R
 - i. concatenate_within_column_function.R
 - (c) set_data_types_by_column_R_function.R
5. Process_PM25_data_step6.R » map locations of monitors by data source/year

1.1.2 Notes about very high data points

June 15, 2012 24-hr average PM_{2.5} concentration from monitor “Smoke #22” (Fire_Cache_Smoke_DRI_Smok is 5,638 ug/m3 - can’t find any reason, so far, to remove this data point, though it’s very odd that the concentrations were low single-digits except for two hours which were extremely high (123,000 and 1000 ug/m3).

1.3 PM_{2.5} Monitor data from US EPA AQS Air Data Query Tool

Data Source

- **Contact**

Can email the Air Quality Analysis Group (U.S. EPA Office of Air Quality Planning and Standards) on their website at <https://www.epa.gov/outdoor-air-quality-data/forms/contact-us-about-outdoor-air-quality>

- **Citation/Link**

United States Environmental Protection Agency. *Pre-Generated Data Files: Daily Summary Files, PM_{2.5} FRM/FEM Mass (88101) and PM_{2.5} non FRM/FEM Mass (88502), 2008-2014*. https://aqs.epa.gov/aqsweb/airdata/download_files.html#Daily

- **Data (local)**

- **Geographic Extent**

- **Temporal Extent** 2008 through 2014

- **Acknowledgment**

Download spreadsheet listing all AQS monitors with datums (https://aqs.epa.gov/aqsweb/airdata/aqs_monitors.zip) from “Monitor Listing” at https://aqs.epa.gov/aqsweb/airdata/download_files.html#Meta. The file name is aqs_monitors.csv in the AQS_Daily_Summaries folder in the S3 data.

Brief Description

We will download PM_{2.5} data from both the US EPA AQS Air Data Query Tool (US EPA, 2017b) and the IMPROVE monitors that capture air quality information in more rural areas (US EPA, 2017d) for the 11-state region (Figure 1) including any of the following parameter codes: 88101, 88500, 88502, 81104 (US EPA, 2017a,c,e).

1.5 PM_{2.5} data from the Federal Land Manager Environmental Database

Data Source

- **Citation/Link** <http://views.cira.colostate.edu/fed/DataWizard/Default.aspx>
- **Download Date** March 15, 2018
- **Data (local)** PM_{2.5} data from the Federal Land Manager Environmental Database
- **Geographic Extent** Nationwide
- **Temporal Extent** January 1, 2008 - December 31, 2014
- **Acknowledgment** - need to fill in

Downloading IMPROVE Aerosol, RHR II (New Equation) data (one parameter at a time):

1. Reports: Raw data
2. Datasets: "IMPROVE Aerosol, RHR II (New Equation)"
3. Sites: select all
4. Parameters:
 - (a) Mass, PM_{2.5} (Fine): Code MF, Type PM_{2.5}, Units ug/m³ LC AQS ID 88101
 - (b) Mass, PM_{2.5} Reconstructed (Fine): Code RCFM, Type PM_{2.5} Units ug/m³ LC, AQS ID 88401
5. Select Dates: By Years and Months: 2008-2014; select all months
6. Aggregations: Non-aggregated
7. Fields: Select All
8. Options: Text File; Generate one file containing all the data; Comma delimited, Standard ("wide" format); Data & Metadata, Display Column Headers, Don't Display Section Titles, String Quotes: Double Quotes, Missing Values (blank); Date Format: 3/14/2002; Display Results: In a separate browser window; Show Report Log
9. Submit

Repeat the downloading steps above, except replace step #2 with these Datasets and parameters:

1. IMPROVE Aerosol, RHR III (DRAFT - Preliminary Most Impaired Days dataset)
 - (a) Mass, PM_{2.5} (Fine) is listed twice - these turned out to be the same data

1.6 PM_{2.5} data from the Fire Cache Smoke Monitor Archive

Data Source

- **Contact** Josh Walston at 775-673-7624; Amber Ortega directed us to the website and Scott Landis suggested that a good person to contact about the page would be Mike Broughton from the US Forest Service (michaelbroughton@fs.fed.us)
- **Citation/Link** <https://wrcc.dri.edu/cgi-bin/smoke.pl>
- **Data (local)** PM_{2.5} data from the Fire Cache Smoke Monitor Archive
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

Notes

Several of the files were password protected, so we contacted Josh and they were able to unlock most of them. As of March 20, 2018, only "Smoke NCFS E-BAM # 3" is still password protected. (Need to try calling Josh again.) Here are some comments that the system administrator passed along to us (via Josh): the data does not get quality controlled, so we should do our own qa/qc. The monitors/data were designed for the fire community to see data in real time, not for research purposes. If we want to speak with the people who ran the monitors, we should contact Josh and the director can probably put us in contact.

Update 2018-05-2018: sent email to Josh requesting the "Smoke NCFS E-BAM # 3" data with flags and with the other formatting settings we used on the other files. Also asked how to determine which datum is associated with the latitude/longitude data.

These monitors were not included because the website indicated that it did not have data during our study period (January 1, 2008 - December 31, 2014):

1. Smoke E-BAM 418
2. Smoke E-BAM 591
3. Smoke E-BAM 592
4. Smoke E-BAM 882
5. Smoke E-BAM 969
6. Smoke USFS R2-922
7. Smoke USFS R2-923
8. Smoke USFS R2-924
9. Smoke USFS R8-34

Download instructions

1. <https://wrcc.dri.edu/cgi-bin/smoke.pl>
2. Hover over the appropriate drop-down menu and click on the monitor you want to download e.g., “Cache Monitors” then “Smoke #11”
3. On the left-side menu, click on “Data Details”
4. Set the starting date: January 1, 2008 (or as far back as it goes if it doesn’t go back to 2008)
5. Set the ending date: December 31, 2014 (or the last date possible if it ends before 2014)
6. Elements (ignore - default is to include all elements)
7. Options
8. Excel (.xls) (It had html code in the file if I chose other options.)
9. Data Source: Original
10. Represent missing data as: -9999.
11. Include data flags: Yes
12. Date format: MM/DD/YYYY hh:mm
13. Time format: LST 0-23
14. Table Header: Column header short descriptions
15. Field Delimiter: comma (,)
16. Select the Units: Metric
17. Leave Sub interval windows set to: January 01, December 31, Hours: 00 and 24
18. Submit Info

Figure 13: Fire Cache Smoke Monitor (DRI) time series.

19. Open in excel
20. Save as: Fire_Cache_Smoke_DRI_*.csv Where * is the monitor name with spaces replaced with underscore and # symbols replaced with the letter N, e.g., the file name for monitor "Smoke #11" is "Fire_Cache_Smoke_DRI_Smoke_N11.csv"
21. Upload file to S3 bucket: <https://732215511434.signin.aws.amazon.com/console>
22. Click on S3
23. Earthlab-reid-group
24. Fire_Cache_Smoke_DRI (folder)
25. Check the following:
26. The name of the monitor is in cell A1
27. The header is spread across rows 2-4
28. There are 34 columns of data (goes through columns "AH" in excel)
29. Concentration in the 11th ("K") columns
30. List the file names in the overleaf documentation (PM25_Fire_Cache_Smoke_Monitor_Archive.tex)

1.7 Fire Cache Smoke Monitor (DRI) Plots

Figure 14: Fire Cache Smoke Monitor (DRI) time series without data above 1000 ug/m3 so that the majority of data can be seen.

1.8 California State Air Quality and Meteorological Information System (AQMIS)

Data Source

- **Contact** Denise Odenwalder, Denise.Odenwalder@arb.ca.gov
- **Citation/Link To AQMIS:** <https://www.arb.ca.gov/aqmis2/aqmis2.php>
- **Data (local)**
- **Geographic Extent** Whole state of California, wherever there are monitors
- **Temporal Extent** 2008-2014, daily averages
- **Acknowledgment** California Air Resources Board was very helpful in gathering and sending us this data.

Brief Description

- PM2.5 measurements at all monitoring stations in CA
- Some entries are 24-hour measurements while others are the average of hourly measurements
- One entry per 3 days

Notes

Reached out to aqmis@arb.ca.gov after determining that there was data being collected in CA that is not published on the EPA AQS website. They emailed us within a week, with a file of the data we requested.

1.10 PM_{2.5} Monitor data from Uintah Basin

Data Source

- **Contact** Seth Lyman
- **Citation/Link** seth.lyman@usu.edu
- **Data (local)** PM_{2.5} measurements from 10 sites in Uintah Basin, Utah
- **Geographic Extent** Uintah Basin, Utah
- **Temporal Extent** October 2009 - March 2017
- **Acknowledgment** PM_{2.5} data from the Uintah Basin were provided by Seth Lyman at Utah State University.

Brief Description

PM_{2.5} data were provided by Seth Lyman at Utah State University via email on January 16, 2018. The .xlsx file has PM_{2.5} data from 10 stations during 2009-2017. The .png file has the longitude and latitude of each site.

Notes

Additional information from Seth's email:

"I've attached most of the PM_{2.5} observations that have ever been collected in the Uintah Basin. What are in the Excel file are 24-hr average data. Data from Roosevelt, Vernal, Ouray, Red Wash, Myton, and Rangely are from the EPA AQS database.

Data from Horsepool are from a BAM 1020 monitor that we operate every winter. Data in Ft. Duchesne and Randlett are 24-hr filter samples that were analyzed gravimetrically. Data from Rabbit Mountain are from a BAM 1020, and data through mid-2013 are in the AQS database.

I have hourly data from Horsepool and Rabbit Mountain if you'd rather have that.

Site locations are given in the list of monitoring stations for the Basin below."

The .png file is easier to read in some programs than others, e.g., it looks fine in "Paint," but not "Photos."

File Formats

Excel and png

Data Filtering and Processing

FinalPM2.5_multiyear_thruwint2017_sheet1.csv is the first sheet of FinalPM2.5_multiyear_thruwint2017.xlsx converted to .csv, and the second row of the header was merged into the first (24hr avg PM_{2.5}).

FinalPM2.5_multiyear_thruwint2017_GISsheet.csv is the third sheet of FinalPM2.5_multiyear_thruwint2017.xlsx converted to .csv and gives the latitude and longitude of each site. This sheet originally did not have location information from the Rangely site, so this was filled in by hand with the numbers from UintahBasinSiteLocations.png.

Brief Description

PM2.5 data from all monitoring stations in Utah

Notes

There was a lot of overlap with the EPA AQS data, so we took data only from the PM2.5 stations not reported by the EPA. This ended up being one or more of three stations (NP, HC, and RS) for 2009, 2010, 2012, and 2013.

Information about the monitoring stations: <http://www.airmonitoring.utah.gov/network/Counties.htm>

Meta information about monitors obtained from <http://www.airmonitoring.utah.gov/dataarchive/2016DailyMaxPM25.pdf>

1.14 MODIS AOD

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

We will use AOD estimates from the Deep Blue retrieval algorithm for AOD from the MODIS instrument on the NASA Terra and Aqua satellites (MOD04_L2 and MYD04_L2) ([Sayer et al., 2013](#)). The MODIS product is available twice daily at a 10 km spatial resolution for cloud-free scenes and is available longer than our 2008-2014 study period ([NASA LAADS DAAC, 2017a,b](#)).

AOD products use cloud filtering algorithms that often remove pixels in the center of the smoke plumes because they are assumed to be clouds due to high reflectivity ([Kondragunta and Seybold, 2009](#)). Given that these can be in the middle of smoke plumes, often the locations most heavily impacted by smoke have missing data for a key variable, AOD. In our previous work in summer in California when rain clouds are incredibly rare, we could be confident that missing values not along the coast were not clouds. However, for this larger study region and time period, this will be a bigger challenge. We will attempt to isolate smoke plumes from true clouds using satellite imagery and smoke plume polygons from NOAA's Hazard Mapping System Fire Smoke Product ([NOAA OSPO, 2017](#)). We will then estimate missing values within validated smoke plumes, but not within clouds, using radial basis functions as was done in our previous work ([Reid et al., 2015](#)). Radial basis functions are exact interpolation functions that will return observed AOD values where they exist but can interpolate higher values than nearby observations in missing locations, which is needed since the missing values were removed due to their high reflectivity ([Reid et al., 2015](#)).

Notes

File Format

.hdf

Data Filtering and Processing

Final Variable(s)

Methods

1. Step 1: Download the MODIS AOD data sets from both Terra and Aqua sensors:

Using the [NASA EarthData online search tool](#), search for the 'MOD04' (Terra) data set. Set temporal extent by drawing polygon and set spatial extent by adjusting the appropriate filter on the web interface. Select the collection and proceed to download data. For data download options, specify "Stage for Delivery" through the "FTPPull" distribution option. Specify the email address for orders to be sent to. Orders will be sent to your email with instructions on how to connect to the FTP server and pull the ordered data into your local workspace through the command line. Because the amount of data being requested is large, the orders will come through several separate emails. Repeat this step for the 'MYD04'

(Aqua) data set. All of the raw downloaded data from this step will be in .hdf file format.

2. Step 2: Set up file system for data processing:

Create a directory locally named 'collected_data'. In this directory, make two child directories named "MOD04_terra" and "MYD04_aqua". Follow instructions in email to download data through FTP into the appropriate MODIS directory ('MOD04_terra' or 'MYD04_aqua') depending on whether the order is from the Terra or Aqua sensor.

3. Step 3: Extract lat, long, and aod values from .hdf files and save into .csv files

Run script 'modis_aod_create_csv_file.py'. This script will take all the .hdf files that you have downloaded and store the lat, long and aod value for non-null pixels from the 'Deep_Blue_Aerosol_Optical_Depth_550_Mid_Resolution' SDS. A .csv file will be created for each corresponding .hdf file.

4. Step 4: Create .shp file for each .csv file

Run 'modis_aod_convert_csv_to_shapefile.py'. This script will read in the .csv files and convert them to .shp files using multiprocessing, which speeds up the process.

5. Step 5: Project .shp files to US Albers Equal Area Conic

Run 'modis_aod_project_to_albers.py'. This script will reproject the .shp files to be US Albers Equal Area Conic (ESRI:102003).

6. Step 6: Combine .shp files for same date and convert to raster with 10km resolution

Run 'modis_aod_create_daily_averages.py'. This will combine all .shp files from the same date and then produce a raster for each with a 10km resolution. Then, the interpolated grids are clipped to the 11 western states (our study area) with a 100km buffer.

7. Step 7: Extract MODIS AOD value at EPA monitor locations

Using ExtractValuesToPoints tool in ArcGIS.

1.15 GASP-West AOD

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

We will use AOD estimates from the Geostationary Operational Environmental Satellite West (GOES-West) Aerosol Smoke Product (GASP-West AOD). The GASP product is available at a 4 km resolution at nadir with retrievals every 30 minutes during daylight hours and is available from 2006 onward ([NOAA NCEI, 2017](#)).

AOD products use cloud filtering algorithms that often remove pixels in the center of the smoke plumes because they are assumed to be clouds due to high reflectivity ([Kondragunta and Seybold, 2009](#)). Given that these can be in the middle of smoke plumes, often the locations most heavily impacted by smoke have missing data for a key variable, AOD. In our previous work in summer in California when rain clouds are incredibly rare, we could be confident that missing values not along the coast were not clouds. However, for this larger study region and time period, this will be a bigger challenge. We will attempt to isolate smoke plumes from true clouds using satellite imagery and smoke plume polygons from NOAA's Hazard Mapping System Fire Smoke Product ([NOAA OSPO, 2017](#)). We will then estimate missing values within validated smoke plumes, but not within clouds, using radial basis functions as was done in our previous work ([Reid et al., 2015](#)). Radial basis functions are exact interpolation functions that will return observed AOD values where they exist but can interpolate higher values than nearby observations in missing locations, which is needed since the missing values were removed due to their high reflectivity ([Reid et al., 2015](#)).

1.19 MODIS Thermal Anomalies/Fire Daily L3 Global 1km (MCD14DL)

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

We will collect data about fire detection locations, size, and fire radiative power from the MODIS Thermal Anomalies/Fire Daily L3 Global 1km (MOD14 and MYD14) ([Giglio et al., 2006](#); [Hawbaker et al., 2017](#)). Using GIS techniques, we will create daily clusters of fire points and use these to calculate: (1) the distance to the nearest fire cluster by day and (2) the sum of Fire Radiative Power (FRP) of the nearest clusters of fires by day as it is likely that smoke levels are higher closer to fires. The MODIS product spans longer than our study period (2008-2014) at daily temporal resolution and has a spatial resolution of 1 km.

Notes

File Format

.shp

Data Filtering and Processing

Final Variable(s)

Methods

1. Navigate to the [NASA EarthData FIRMS Archive Download site](#)
2. Select "Create new Request"
3. In the dropdown for region, select "Custom Region" and draw a bounding box around study area
4. In the dropdown for fire data source, select "MODIS C6"
5. Select dates for study time period
6. In the dropdown for file type, select "Shapefile (.shp)"
7. Enter your email address
8. You will get an email with a download link containing a zipfile with the data
9. Run `active_fire.py` with the required arguments. This script will spatially join the fire data with the timezone data. This is a necessary step for adjusting the timestamp from UTC to local in the next step.

10. Create fields "ACQ_TIME" and "ACQ_DATE" in ArcMap, QGIS, or any other method of your choosing in the output shp file from the previous step. Extract the time and date from the "adj_time" column to populate these new fields.
11. Run buffers.py with the required arguments. This script will take in a csv file with lat, lon, and dates (the PM2.5 stations/points of interest), a shp file with buffers around each of these observation (specified as arguments), the fire shp file that was edited in the previous step, and an output csv filename. The output is a csv file similar to the input csv, but with an additional columns that includes the number of active fires in each buffer. Note: the buffer shp file used in this study was created with geodesic buffering due to the large buffer sizes used (25km, 50km, 100km, 500km radiuses). We decided that it would be better to use geodesic buffering for large areas (as opposed to planar buffering) because they will not be affected by distortion introduced from the projection, which is a bigger issue with larger areas.
12. Run merge_with_zeros.py with the required arguments. This merges the dataframe created in the previous step with the original dataframe of station locations and dates with over 1 million rows. It matches the rows with fire counts and give a value of 0 for all else.

1.20 Landsat-derived burned area essential climate variable (BAECV) fire activity data

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

We will collect data about fire detection locations, size, and fire radiative power from the Landsat-derived burned area essential climate variable (BAECV) fire activity data, ([LP DAAC, 2017](#)). Using GIS techniques, we will create daily clusters of fire points and use these to calculate: (1) the distance to the nearest fire cluster by day and (2) the sum of Fire Radiative Power (FRP) of the nearest clusters of fires by day as it is likely that smoke levels are higher closer to fires. The BAECV can detect fires larger than 4 km² and provides an estimate of the date of the fire and is available from 1984-2015.

Notes

File Format

.shp

Data Filtering and Processing

Final Variable(s)

Methods

1. BAECV data set already downloaded by EarthLab fire group. Navigate to the ‘earthlab-ls-fire’ S3 bucket, then the v1.1 subdirectory. Here you will find yearly .tar.gz files. Have not spent time decompressing files and exploring data yet but my guess is that within each yearly file, we will find more detailed, daily burn data.

1.23 Classified land cover information from the Landsat-derived NLCD 2011

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

Classified land cover information from the Landsat-derived NLCD 2011 ([Homer et al., 2017](#)) will be used to calculate estimates of the percentage of urban development (codes 22, 23, and 24), agriculture (codes 81 and 82), and vegetated area other than agricultural land (codes 21, 41, 42, 43, 52, and 71) within buffer radii of 100 m, 250 m, 500 m, and 1000 m around each monitor. The buffer distance that is most highly correlated with $PM_{2.5}$ will be entered into each model. NLCD 2011 has a spatial resolution of 30 m and uses circa 2011 Landsat satellite data.

Notes

File Format

.shp

Data Filtering and Processing

Final Variable(s)

Methods

1. Navigate to the [National Map Viewer](#) and find products for "National Land Cover Database (NLCD)" at the National extent. From the search results, download "NLCD 2011 Land Cover (2011 Edition, amended 2014)". This will download a zipfile with the data.
2. Run `nlcd_process.py` with the required arguments. This script computes zonal statistics between a buffer shp file and an classified raster tif (in our use case, a reclassified NLCD raster). The computed value is percent area of developed high density land cover in each buffer. The output is another csv, which is the input csv with an an extra column denoting the data. Note: the buffer shp file used in this study consisted of 1km, 5km, and 10km radius buffers using planar buffering.

1.24 MODIS Snow Cover Daily L3 Global 500m Grid, Version 6 (MOD10A1 and MYD10A1)

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

We will use snow cover data from the MODIS Snow Cover Daily L3 Global 500m Grid, Version 6 (MOD10A1 and MYD10A1) ([Hall and Riggs, 2016](#)) because snow coverage is a known contributor to wintertime PM_{2.5} concentrations in mountain valleys ([Whiteman et al., 2014](#)). Daily MOD10A1 and MYD10A1 data are available since 2002 and have 500 m spatial resolution.

Notes

File Format

Data Filtering and Processing

Final Variable(s)

Methods

1. Step 1: Download the MODIS AOD data sets from both Terra and Aqua sensors:

Using the [NASA EarthData online search tool](#), search for the 'MOD10A1' (Terra) data set. Set temporal extent by drawing polygon and set spatial extent by adjusting the appropriate filter on the web interface. Select the collection and proceed to download data. For data download options, specify "Stage for Delivery" through the "FTPPull" distribution option. Specify the email address for orders to be sent to. Orders will be sent to your email with instructions on how to connect to the FTP server and pull the ordered data into your local workspace through the command line. Because the amount of data being requested is large, the orders will come through several separate emails. Repeat this step for the 'MYD10A1' (Aqua) data set. All of the raw downloaded data from this step will be in .hdf file format.

1.27 Meteorological Data

Data Source

North American Mesoscale, Analysis (NAM)

- **Contact**
- **Citation/Link** <https://www.ncdc.noaa.gov/data-access/model-data/model-datasets/north-american-mesoscale-analysis>
<https://nomads.ncdc.noaa.gov/data/namanl/>
- **Geographic Extent** North America
- **Temporal Extent** Available March, 2004 - present with slight delay
- **Acknowledgment**

Brief Description

We will obtain meteorological data from the North American Mesoscale, Analysis (NAM) because it includes all of the standard meteorological variables, including planetary boundary layer height, which has proved to be an important variable for converting AOD to PM_{2.5} (Liu et al., 2005). We will calculate 24-hour averages from 6-hourly data for temperature, relative humidity, sea level pressure, surface pressure, planetary boundary layer height, dew point temperature, precipitation, snow coverage, and the U and V components of wind speed. NAM has 12 km resolution and is available 2004 onward.

Notes

File Format

Prior to 2018, the files are in *.grb (“grib1”) format, while 2018 data is in *.grb2 (“grib2”) format.

Resources about this file type:

- rNOMADS is an R package for accessing grb* files. It is mostly geared for grib2 files.
<https://cran.r-project.org/web/packages/rNOMADS/rNOMADS.pdf>
- Explanation of what grib files are: http://www.cpc.ncep.noaa.gov/products/wesley/reading_grib.html,
- wgrib program information: <http://www.cpc.ncep.noaa.gov/products/wesley/wgrib.html>

Data Filtering and Processing

1. Use the earthlab/r-reidgroup docker image, which has wgrib and wgrib2 <http://www.cpc.ncep.noaa.gov/products/wesley/wgrib.html> and wgrib2 <http://www.cpc.ncep.noaa.gov/products/wesley/wgrib2/> installed on it.
2. Process_NAM_data_step1.R reads in Locations_Dates_of_PM25_Obs_DeDuplicate.csv and outputs Locations_Dates_of_PM25_Obs_DeDuplicate_wNextDay.csv, which includes the next day for each location/day listed in the first file. The purpose of this is so all of the necessary NAM files can be processed. UTC dates can go into the next day for western US time zones. This step uses these input files and R packages and functions:
 - (a) Locations_Dates_of_PM25_Obs_DeDuplicate.csv
 - (b) add_next_day_date_loc_function.R.

3. Process_NAM_data_step2_parallel.R downloads each NAM file, extracts relevant data, and deletes the original NAM data. (All of the NAM files together would be about 1.6 Tb.) This file operates in parallel, and will use n-1 cores, where n is the number of cores on the computer. The output is 1 csv with all locations of interest for a given date and time step. The time steps for the NAM are 0Z, 6Z, 12Z, and 18Z. The output files have the format Locations_Dates_of_PM25_Obs_DeDuplicate_YYYY_MM_DD_XXUTC.csv where XX refers to the timestep. Change the study start and stop dates for the dates to be processed. This step uses these input files and R packages and functions:
 - (a) Locations_Dates_of_PM25_Obs_DeDuplicate.csv - Data file with dates (local) and locations where you want the NAM data
 - (b) MeteoVariablesNAM.csv - listing of meteorological variables to be extracted from NAM data
 - (c) rNOMADS R package (which calls wgrib and wgrib2) <https://cran.r-project.org/web/packages/rNOMADS/rNOMADS.pdf>
 - (d) parallel R package
 - (e) grb1to2_conversion_prep_function.R - This script downloads the files that will be necessary to run grb1to2.pl, created by the Climate Prediction Center <http://www.cpc.ncep.noaa.gov/products/wesley/grb1to2.html>
 - (f) loop_NAM_run_times_parallel_function.R - this function loops through the time steps on a given day and calls function (listed below) to extract meteo data at locations of interest
 - (g) define_project_bounds_function.R - the bounding box for the study area is defined in this function. The scripts can run faster if the entire NAM domain does not need to be loaded into memory.
 - (h) extract_NAM_data_parallel_function.R - this function extracts the NAM data at points of interest
 - (i) which_type_of_grib_file_function.R - this function determines whether the data for a given time step are grib1 or grib2 format
 - (j) convert_grib1to2_function.R - convert file type from grib1 to grib2, unless it's already a grib2 file. This is essentially a wrapper for grb1to2.pl created by the Climate Prediction Center <http://www.cpc.ncep.noaa.gov/products/wesley/grb1to2.html>
4. Process_NAM_data_step3.R merges all of the files from step 2 into a single file and adds a column at the beginning giving the UTC time stamp.
5. Process_NAM_data_step4.R To Do: deal with time zones and compiling 24-hr summaries
6. To Do: Merge_NAM_times.R will merge the 4 time steps to give a 24-hr summary. Min, max, mean, etc. is set in MeteoVariablesNAM.csv.

1.28 Dust Storms

Data Source

- **Contact**
- **Citation/Link**
- **Data (local)**
- **Geographic Extent**
- **Temporal Extent**
- **Acknowledgment**

Brief Description

Dust storm records will be included in the machine learning algorithm because they can be a significant indicator of airborne particulate matter from sources other than fires. Dust storm records are available from 1993-2017. The spatial resolution varies, but includes either forecast zone or county ([US National Weather Service, 2017b,c,a](#)).

Data File Names

- 1.

1.29 Locations of Interest

This section describes the code for identifying and compiling the predictor variables for locations of interest, such as county centroids.

1.29.1 County Centroids

1. CountyCentroid_CreateLatLonDateFiles.R » Create two csv files in the /home/Processed_Data/CountyCentroid/ folder. This script takes approximately 6 minutes to run on a laptop.
 - (a) Locations of county centroids for the study area: CountyCentroid_Locations.csv (~ 30 KB)
 - (b) Locations of county centroids for study area expanded across all dates in study period: CountyCentroid_Locations_Dates_[Study Start Date]to[Study End Date].csv (~ 140 MB)
2. CountyCentroid_PlotLocations.R » Plot centroid locations and create summaries of the locations-only and dates-locations centroids files in CountyCentroid_Locations_File_Summary.txt, which is stored in the same folder as the data. This script takes a few seconds to run on a laptop.

1.29.2 Population-weighted county centroids

1. Extract_county_pop_centroids.R **To Do:** update this code to have a similar process as the geographic county centroid codes listed above.

1.29.3 Geometric Centroids of Counties Images

Geometric Centroids of Counties

Figure 17: Geometric Centroids of Counties

2 Phase 2: Extraction to Observation Locations and Points of Interest

3 Phase 3: Merge extracted data

This phase both the input file for the ML training and the input file for the predictions to points of interest.

3.1 Predictor input files for points of interest

Once the predictor variables have been extracted to the points of interest, these need to be merged into a single input file for each type of point of interest (e.g., geometric county centroid, population-weighted county centroid, etc.).

1. Merge_predictors_to_points_of_interest.R » Merge the predictor variables to the locations of interest for each set of points of interest. The file names for the source files will need to be updated as more predictor data is processed. This script takes about 2 minutes on a laptop. This script calls this function:
 - (a) Merge_predictors_to_points_of_interest_parallel_wrapper_function.R
2. Plot_Predictor_Inputs.R » Plot prediction input files that were created with above script. This script takes several minutes to run on laptop.

4 Phase 4: Machine Learning Methods

setting aside a portion of the PM2.5 data set and then doing 10-fold cross validation on the rest of the data

see <http://www.cvent.com/events/nasa-aist-machine-learning-workshop/event-summary-1f5144a5d1734ca.aspx> and particularly the very end of <https://global.gotomeeting.com/public/recording-player.html?id=owZDmUustOjaW9sJGQ5u9cUG2pBa4D> for list of resources and papers to read.

4.1 ML Scripts

1. ML_PM25_estimation_merge_predictors.R » Merge the various predictor variables together with the monitor data or dates/locations of interest
2. ML_PM25_estimation_plot_predictors.R » Plot the training input file
 - (a) predictor variables vs date
 - (b) predictor variables vs PM_{2.5}
3. ML_PM25_estimation_step1.R » ML training algorithms
4. ML_PM25_estimation_step1.R » create data frame of the dates/locations for which we want to predict PM2.5

5 Phase 5: Predictions to Points of Interest

6 Ideas, To Do, Resources, etc

code up fires by type of land coverage

Consider using the work of Westerling et al for a comprehensive fire history (up through 2012) <http://science.sciencemag.org/content/313/5789/940>, <http://www.pnas.org/content/108/32/13165>, <http://rstb.royalsocietypublishing.org/content/371/1696/20150178> Westerling (2016b,a) Also look into the fire histories referenced in Westerling Westerling (2016b,a): http://fam.nwcg.gov/fam-web/weatherfirecd/fire_files.htm and <http://fam.nwcg.gov/fam-web/kcfast/mnmenu.htm> See also <http://www.nifc.gov>

look into the Fire and Smoke Model Evaluation Experiment (FASMEE) <http://www.fasmee.net>

Compare our results with EPA Downscaler <https://www.epa.gov/air-research/downscaler-model-predicting->

Look at Kollanus et al. (2016) again for references for PM2.5 paper, especially the introduction.

Consider using NAAPS in our study.

read ?

read ?

see also <https://www.5280.com/2018/09/can-colorado-burn-its-way-out-of-a-wildfire-crisis/>

Could we use inciweb to distinguish prescribed fires?

look up Global Fire Emissions Database (GFED3) - maybe it would be useful for our study as an input to the machine learning? see Liu et al. (2016)

see ? for potential data sources for ML project

emissions vary by temperature <https://cires.colorado.edu/news/wildfire-temperatures-key-better-understand> and <https://www.atmos-chem-phys.net/18/9263/2018/>

read Monitoring Trends in Burn Severity MTBS, 2014. Data Access: Fire Level Geospatial Data. US Department of Agriculture, Forest Service and US Department of Interior, Geological Survey. <http://mtbs.gov/data/individualfiredata.html/>.

Idea: look at ambulance calls and PM2.5, similar to what Salimi et al. (2016) did in Australia.

read ?

Database of planned/proposed prescribed burns: WRAP's Fire Emissions Tracking System: <http://wrapfets.org/index.cfm>

See Di et al., 2016 and Johnston et al., 2012, Rappold et al., 2014 in ? - combine modelled and monitored/satellite data to estimate PM2.5

See page 11 of ? for discussion of discrepancies related to burned area estimates

<http://www.ptep-online.com/ctan/symbols-a4.pdf>

US National Atlas http://nationalmap.gov/small_scale/atlasftp.html

Thought: Using DigitalGlobe for fire data compared to NASA: would have higher spatial resolution, but not consistently viewing all areas (no cost to CU people)

Look up Openair R package

Papers/resources to look into: https://daac.ornl.gov/cgi-bin/dsviewer.pl?ds_id=1293

https://www.fs.fed.us/psw/publications/4451/psw_2009_4451-001.pdf

<https://labcit.ligo.caltech.edu/~ethrane/Resources/UNIX/>

<https://community.tableau.com/thread/141548>

According to ?, GEOS-Chem “can be classified according to emission source”, that implies that we could tag the emissions as wildfire vs prescribed fire vs urban. Would there be any advantages of this model over CAMx?

could analyze data with NAAQS and WHO PM2.5 standards

projection/datum info: <https://gis.stackexchange.com/questions/664/whats-the-difference-between-a-projection-and-a-datum>

<http://grindgis.com/blog/wgs84-vs-nad83>

Monitoring Trends in Burn Severity (MTBS) MTBS, 2016: Data Access: Fire Level Geospatial Data. USDA Forest Service/U.S. Geological Survey, accessed 8 October 2016, <https://mtbs.gov/direct-download>. Eidenshink, J., B. Schwind, K. Brewer, Z.-L. Zhu, B. Quayle, and S. Howard, 2007: A project for monitoring trends in burn severity. *Fire Ecol.*, 3, 3–21, <https://doi.org/10.4996/fireecology.0301003>.

Idea: Maybe instead of just distance to closest fire, we should follow the example of [Baek2016] and do distributed lags with concentric circles with information about fires in each concentric circle... also, instead of just distance to fire, maybe we could come up with a variable that is something like [distance*size of fire] since both are important.

Fire stats/records: https://www.nifc.gov/fireInfo/fireInfo_statistics.html

See ? for description of fire perimeter data that perhaps we could use (CA only)

See ? for info about MTBS and Active Fire Mapping Program and NWS smoke products. See also Lassman et al ? cited therein.

Read these papers cited in ? : Yao and Henderson, 2014; Henderson et al 2011; Liu et al 2015; Gan et al 2017; and look at their sources of PM2.5 data to see if we could add any of those to our project.

7 PM2.5 Surface Paper Notes

Discussion of trends in anthro PM2.5: ?

7.1 Papers published in Atmospheric Environment - use as style example

Need to go through these papers

- [Brokamp et al. \(2017\)](#) (partially done, done through intro)
- [Sampson et al. \(2013\)](#)
- [Anyenda et al. \(2016\)](#)
- [Torvela et al. \(2014\)](#)
- [Whiteman et al. \(2014\)](#)

Put in [Brokamp et al. \(2017\)](#); [Larsen et al. \(2017\)](#)

8 Papers to cite/discuss in Introduction and/or Discussion

[Westerling \(2016b,a\)](#)

try to find English version <http://80.24.165.149/webproduccion/PDFs/15CAP03.PDF>

For fire identification, consider using NOAA's Hazard Mapping System and BlueSky

8.1 Notes on Papers

See [J. et al. \(2016\)](#) for statistics about wildfires in western US, e.g., % started by humans, number of fires, etc.

9 Fire attribution paper

revisit ?

include ? - does a good job of summarizing the debate about more vs less prescribed burns
sources of fire data ?, ?

will need to compare our work to ?

include [Westerling \(2016b,a\)](#) and [Abatzoglou and Williams \(2016\)](#)

See ? for an alternative method of attributing PM2.5 to wildfire smoke (instead of CAMx)

See Le et al 2014 ?

See Huff et al ?

9.1 text written for the COPD paper - variation of this may be useful

Larsen et al., 2017 [Larsen et al. \(2017\)](#) found that, on average, ground-level PM_{2.5} concentrations increased by $2.9 \mu\text{g}\cdot\text{m}^{-3}$ (2.8, 3.0) when there was a visible wildfire smoke plume overhead (from satellite imagery), as well as a 2.6 ppb (2.5-2.7) increase in O₃. Satellite data provides a wealth of data and can provide information about air quality where monitors are not present. However, satellite imagery inherently comes with a substantial uncertainty in that satellite data describes the entire atmospheric column and not specifically just air pollution at the ground level, where people are breathing.
